## Dual Nature of Radiation and Matter

Answers
11.1 (d)
11.2 (b)
11.3 (d)
11.4 (c)
11.5 (b)
11.6 (a)
11.7 (a)
11.8 (c)
11.9 (c), (d)
11.10 (a), (c)
11.11 (b), (c)
(b), (d)
$11.14 \quad \lambda_{p} / \lambda_{d}=p_{x} / p_{p}=\frac{\sqrt{2 m_{\alpha} E_{\alpha}}}{\sqrt{2 m_{p} E_{p}}}=\sqrt{8}: 1$
11.15 (i) $E_{\max }=2 h v-\phi$ (ii) The probability of absorbing 2 photons by the same electron is
very low. Hence such emissions will be negligible.
11.16 In the first case energy given out is less than the energy supplied. In the second case, the material has to supply the energy as the emitted photon has more energy. This cannot happen for stable substances.
11.17 No, most electrons get scattered into the metal. Only a few come out of the surface of the metal.
11.18 Total $E$ is constant

Let $n_{1}$ and $n_{2}$ be the number of photons of $X$-rays and visible region
$n_{1} E_{1}=n_{2} E_{2}$
$n_{1} \stackrel{h c}{\lambda_{1}}=n_{2} \frac{h c}{\lambda_{2}}$
$\frac{n_{1}}{n_{2}}=\frac{\lambda_{1}}{\lambda_{2}}$.
$\frac{n_{1}}{n_{2}}=\frac{1}{500}$.
11.19 The momentum is transferred to the metal. At the microscopic level, atoms absorb the photon and its momentum is transferred mainly to the nucleus and electrons. The excited electron is emitted. Conservation of momentum needs to be accounted for the momentum transferred to the nucleus and electrons.
11.20 Maximum energy $=h v-\phi$

$$
\begin{aligned}
& \left(\frac{1230}{600}-\phi\right)=\frac{1}{2}\left(\frac{1230}{400}-\phi\right) \\
& \phi=\frac{1230}{1200}=1.02 \mathrm{eV}
\end{aligned}
$$

$11.21 \Delta x \Delta p ; \mathrm{h}$
$\Delta p ; \frac{\mathrm{h}}{\Delta x} ; \frac{1.05 \times 10^{-34} \mathrm{Js}}{10^{-9} \mathrm{~m}}=1.05 \times 10^{-25}$

$$
=3.8 \times 10^{-2} \mathrm{eV}
$$

11.22

$$
\begin{aligned}
& I=n_{A} n_{A}=n_{B} v_{B} \\
& \frac{n_{A}}{n_{B}}=2=\frac{v_{B}}{v_{A}}
\end{aligned}
$$

The frequency of beam $B$ is twice that of $A$.
$11.23 p_{c}=\left|p_{A}\right|+\left|p_{B}\right|=\frac{h}{\lambda_{A}}+\frac{h}{\lambda_{B}}=\begin{aligned} & h \\ & \lambda_{c}\end{aligned}=\frac{h}{\lambda_{c}}$ if $p_{A}, p_{B}>0$ or $p_{A}, p_{B}<0$

$$
\begin{aligned}
& \text { or } \lambda_{c}=\frac{\lambda_{A} \lambda_{B}}{\lambda_{A}+\lambda_{B}} \\
& \text { If } p_{A}>0, \mathrm{p}_{\mathrm{B}}<\mathrm{O} \text { or } p_{A}<\mathrm{O}, \mathrm{p}_{\mathrm{B}}>0 \\
& p_{c}=h \frac{\lambda_{B}-\lambda_{A}}{\left|\lambda_{A} \cdot \lambda_{B}\right|}=\frac{h}{\lambda_{c}} \\
& \lambda_{c}=\frac{\lambda_{B} \cdot \lambda_{A}}{\left|\lambda_{A}-\lambda_{B}\right|} .
\end{aligned}
$$

$11.242 d \sin \theta=\lambda=d=10^{-10} \mathrm{~m}$.

$$
\begin{gathered}
p=\frac{h}{10^{-10}}=\frac{6.6 \times 10^{-34}}{10^{-10}}=6.6 \times 10^{-21} \mathrm{~kg} \mathrm{~m} / \mathrm{s} \\
E=\frac{\left(6.6 \times 10^{-24}\right)^{2}}{2 \times\left(1.7 \times 10^{-27}\right)} \times 1.6 \times 10^{-19}=\frac{6.6^{2}}{2 \times 1.7} \times 1.6 \times 10^{-2} \mathrm{eV} \\
=20.5 \times 10^{-2} \mathrm{eV}=0.21 \mathrm{eV}
\end{gathered}
$$

$11.256 \times 10^{26} \mathrm{Na}$ atoms weighs 23 kg .
Volume of target $=\left(10^{-4} \times 10^{-3}\right)=10^{-7} \mathrm{~m}^{3}$
Density of sodium $=(d)=0.97 \mathrm{~kg} / \mathrm{m}^{3}$
Volume of $6 \times 10^{26} \mathrm{Na}$ atoms $=\frac{23}{0.97} \mathrm{~m}^{3}=23.7 \mathrm{~m}^{3}$
Volume occupied of 1 Na atom $=\frac{23}{0.97 \times 6 \times 10^{26}} \mathrm{~m}^{3}=3.95 \times 10^{-26} \mathrm{~m}^{3}$
No. of sodium atoms in the target $=\frac{10^{-7}}{3.95 \times 10^{-26}}=2.53 \times 10^{18}$
Number of photons $/ \mathrm{s}$ in the beam for $10^{-4} \mathrm{~m}^{2}=n$
$h v($ for $\lambda=660 n m)=\frac{1234.5}{600}$

$$
=2.05 \mathrm{eV}=2.05 \times 1.6 \times 10^{-19}=3.28 \times 10^{-19} \mathrm{~J}
$$

$n=\frac{10^{-2}}{3.28 \times 10^{-19}}=3.05 \times 10^{16} / \mathrm{s}$
$n=\frac{1}{3.2} \times 10^{17}=3.1 \times 10^{16}$
If P is the probability of emission per atom, per photon, the number of photoelectrons emitted/second
$=P \times 3.1 \times 10^{16} \times 2.53 \times 10^{18}$
Current $=\mathrm{P} \times 3.1 \times 10^{+16} \times 2.53 \times 10^{18} \times 1.6 \times 10^{-19} \mathrm{~A}$

$$
=\mathrm{P} \times 1.25 \times 10^{+16} \mathrm{~A}
$$

This must equal $100 \mu \mathrm{~A}$ or
$P=\frac{100 \times 10^{-6}}{1.25 \times 10^{+16}}$
$\therefore P=8 \times 10^{-21}$
Thus the probability of photemission by a single photon on a single atom is very much less than 1. (That is why absorption of two photons by an atom is negligible).
11.26 Work done by an external agency $=+\frac{1}{4 \pi \varepsilon_{0}} \cdot \frac{1}{4} \int_{d}^{\infty} \frac{q^{2}}{x^{2}} d x=\frac{1}{4} \cdot \frac{q^{2}}{4 \pi \varepsilon_{0} d}$

With $d=0.1 \mathrm{~nm}$, energy $=\frac{\left(1.6 \times 10^{-19}\right) \times 9 \times 10^{9}}{4\left(10^{-10}\right) \times 1.6 \times 10^{-19}} \mathrm{eV}$

$$
=\frac{1.6 \times 9}{4} \mathrm{eV}=3.6 \mathrm{eV}
$$

11.27 (i) Stopping potential $=0$ at a higher frequency for $B$. Hence it has a higher work function.
(ii) Slope $=\frac{h}{e}=\frac{2}{(10-5) \times 10^{14}}$ for A .

$$
=\frac{2.5}{(15-10) \times 10^{14}} \text { for } \mathrm{B}
$$

$=\frac{1.6 \times 10^{-19} \times 2.5 \times 10^{-14}}{5}=8 \times 10^{-34} \mathrm{Js}$ for B.
Since $h$ works out differently, experiment is not consistent with the theory.
$11.28 \quad m_{A} v=m_{A} v_{1}+m_{B} v_{2}$

$$
\begin{aligned}
& \frac{1}{2} m_{A} v^{2}=\frac{1}{2} m_{A} v_{1}^{2}+\frac{1}{2} m_{B} v_{2}^{2} \\
& \therefore \frac{1}{2} m_{A}\left(v-v_{1}\right)\left(v_{A}+v_{1}\right)=\frac{1}{2} m_{B} v_{B}^{2} \\
& \therefore v+v_{1}=v_{2} \\
& \text { or } v=v_{2}-v_{1}
\end{aligned}
$$

$$
\therefore v_{1}=\left(\frac{m_{A}-m_{B}}{m_{A}+m_{B}}\right) v, \quad \text { and } \quad v_{2}=\left(\frac{2 m_{A}}{m_{A}+m_{B}}\right) v
$$

$$
\therefore \lambda_{\text {initial }}=\frac{h}{m_{A} v}
$$

$$
\lambda_{\text {final }}=\frac{h}{m_{A} v}=\left|\frac{h\left(m_{A}+m_{B}\right)}{m_{A}\left(m_{A}-m_{B}\right) v}\right|
$$

$$
\therefore \Delta \lambda=\frac{h}{m_{A} v}\left[\left|\frac{\left.m_{A}+m_{B}\right)}{m_{A}-m_{B}}\right|-1\right]
$$

11.29 (i) $\frac{d N}{d t}=\frac{P}{(h c / \lambda)}=5 \times 10^{19} / \mathrm{sec}$
(ii) $\frac{h c}{\lambda}=2.49 \mathrm{eV}>W_{0}$ : Yes.
(iii) $P \cdot \frac{\pi r^{2}}{4 \pi d^{2}} \Delta t=W_{0}, \Delta t=28.4 \mathrm{~s}$

(iv) $N=\left(\frac{d N}{d t}\right) \times \frac{\pi r^{2}}{4 \pi d^{2}} \times \Delta t=2$
