23. (i), (iii)

## III. Short Answer Type

24. $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{3} \mathrm{Cl}_{3}\right]<\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Cl}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Cl}_{2}<\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right] \mathrm{Cl}_{3}$
25. $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4} \mathrm{Cl}_{2}\right] \mathrm{Cl}$ (tetraaquadichloridocobalt(III) chloride)
26. An optically active complex of the type $\left[\mathrm{M}(\mathrm{AA})_{2} \mathrm{X}_{2}\right]^{\mathrm{n}+}$ indicates cisoctahedral structure, e.g. cis-[Pt(en) $\left.{ }_{2} \mathrm{Cl}_{2}\right]^{2+}$ or cis- $\left[\mathrm{Cr}(\mathrm{en})_{2} \mathrm{Cl}_{2}\right]^{+}$
27. The magnetic moment of 5.92 BM corresponds to the presence of five unpaired electrons in the $d$-orbitals of $\mathrm{Mn}^{2+}$ ion. As a result the hybridisation involved is $s p^{3}$ rather than $d s p^{2}$. Thus tetrahedral structure of $\left[\mathrm{MnCl}_{4}\right]^{2-}$ complex will show 5.92 BM magnetic moment value.
28. With weak field ligands; $\Delta_{\mathrm{O}}<\mathrm{p}$, the electronic configuration of Co (III) will be t ${ }_{2 \mathrm{~g}} \mathrm{e}^{2}{ }_{\mathrm{g}}$ and it has 4 unpaired electrons and is paramagnetic. With strong field ligands, $\Delta_{0}>p$, the electronic configuration will be $t^{6}{ }_{2 g} \mathrm{e}_{\mathrm{g}}^{0}$. It has no unpaired electrons and is diamagnetic.
29. Because for tetrahedral complexes, the crystal field stabilisation energy is lower than pairing energy.
30. $\left[\mathrm{CoF}_{6}\right]^{3-}, \operatorname{Co}^{3+}\left(d^{6}\right) t_{2 \mathrm{~g}}^{4} e_{\mathrm{g}}^{2}$,
$\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}, \mathrm{Fe}^{2+}\left(d^{6}\right) t_{2 \mathrm{~g}}^{6} e_{\mathrm{g}}{ }^{0}$,
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{6}\right]^{2+}, \mathrm{Cu}^{2+}\left(d^{9}\right) t_{2 \mathrm{~g}}^{6} e_{\mathrm{g}}{ }^{3}$,
31. $\left[\mathrm{Fe}(\mathrm{CN})_{6}{ }^{3-}\right.$ involves $d^{2} s p^{3}$ hybridisation with one unpaired electron and $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$ involves $s p^{3} d^{2}$ hybridisation with five unpaired electrons. This difference is due to the presence of strong ligand $\mathrm{CN}^{-}$and weak ligand $\mathrm{H}_{2} \mathrm{O}$ in these complexes.
32. Crystal field splitting energy increases in the order $\left[\mathrm{Cr}(\mathrm{Cl})_{6}\right]^{3-}<\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$ $<\left[\mathrm{Cr}(\mathrm{CN})_{6}\right]^{3-}$
33. It is due to the presence of weak and strong ligands in complexes, if CFSE is high, the complex will show low value of magnetic moment and vice versa, e.g. $\left[\mathrm{CoF}_{6}\right]^{3-}$ and $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$, the former is paramagnetic and the latter is diamagnetic.
34. In $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}$, water acts as ligand as a result it causes crystal field splitting. Hence d-d transition is possible in $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ and shows colour. In the anhydrous $\mathrm{CuSO}_{4}$ due to the absence of water (ligand), crystal field splitting is not possible and hence no colour.
35. Linkage isomerism

Examples: (i)

$\begin{array}{lll}\text { (ii) } & \mathrm{M} \leftarrow \mathrm{SCN} & \mathrm{M} \leftarrow \mathrm{NCS} \\ & \text { thiocyanato } & \\ \text { isothiocyanato }\end{array}$
IV. Matching Type
36. (ii)
37. (i)
38. (ii)
39. (iv)
40. (i)
V. Assertion and Reason Type
41. (i)
42. (ii)
43. (i)
44. (ii)
45. (iv)
V. Long Answer Type
46. (i) $\left[\mathrm{CoF}_{6}\right]^{3-}$

i.e. $t_{2 g}^{4} e_{g}^{2}$

$$
\mathrm{Co}^{3+}=3 d^{6}
$$

Number of unpaired electrons $=4$

$$
\sqrt{n(n+2)}=\sqrt{4(4+2)}=\sqrt{24}=4.9 \mathrm{BM}
$$

Number of unpaired electrons $=3$
$\sqrt{3(3+2)}=\sqrt{15}=3.87 \mathrm{BM}$

i.e. $\mathrm{t}_{2 \mathrm{~g}}^{6} \mathrm{e}_{\mathrm{g}}^{0}$

No unpaired electrons so diamagnetic
(ii) $\mathrm{FeF}_{6}{ }^{3-}$

i.e. $\mathrm{t}_{2 \mathrm{~g}}^{3} \mathrm{e}_{\mathrm{g}}^{2}$
$\mathrm{Fe}^{3+}=3 d^{5}$

Number of unpaired electrons $=5$
$\sqrt{5(5+2)}=\sqrt{35}=5.92 \mathrm{BM}$

Number of unpaired electrons $=4$

$$
\sqrt{4(4+2)}=\sqrt{24}=4.9 \mathrm{BM}
$$

$\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4}$
$\mathrm{Fe}^{2+}=3 d^{6}$
Since $\mathrm{CN}^{-}$is strong field ligand all the electrons get paired．

No unpaired electrons so diamagnetic
47.

（i）$d^{2} s p^{3}$
（ii）Inner orbital complex
（iii）Paramagnetic
（iv）$\sqrt{2(2+2)}=\sqrt{8}=2.87 \mathrm{BM}$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$
$\mathrm{Co}^{3+}=3 d^{6}$

| $3 d$ | 4s | $4 p$ |
| :---: | :---: | :---: |
| 代珄们 $\times \times \times \times \times$ | x $\times$ | ｜x｜$\times \times \times 1 \times x$ |
|  | $s p^{3}$ |  |

（i）$d^{2} s p^{3}$
（ii）Inner orbital complex
（iii）Diamagnetic
（iv）Zero

（i）$d^{2} s p^{3}$
（ii）Inner orbital complex
（iii）Paramagnetic
（iv） 3.87 BM

(i) $\quad s p^{3} d^{2}$ (ii)

Outer orbital complex
(iii) Paramagnetic
(iv) 4.9 BM
48. (i) $\mathrm{A}-\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{SO}_{4}\right] \mathrm{Cl}$
$\mathrm{B}-\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{SO}_{4}$
(ii) Ionisation isomerism
(iii) (A), Pentaamminesulphatocobalt (III) chloride
(B), Pentaamminechlorocobalt (III) sulphate.
49. When white light falls on the complex, some part of it is absorbed. Higher the crystal field splitting, lower will be the wavelength absorbed by the complex. The observed colour of complex is the colour generated from the wavelength left over.
50. $t\left(\frac{4}{9}\right) \Delta_{0}$. So higher wavelength is absorbed in octahedral complex than tetrahedral complex for same metal and ligands.
