## Relations and Functions

## 1. What is Cartesian Sets?

Given two non-empty sets $\backslash(A \backslash)$ and $\backslash(B \backslash)$. The Cartesian product $\backslash(A$ ltimes $B \backslash)$ is the set of all ordered pairs of elements from $\backslash(A \backslash)$ and $\backslash(B \backslash)$, i.e.,
$\backslash(A \backslash t i m e s ~ B=\ l e f t \backslash\{\backslash l e f t(\{a, b\} \backslash r i g h t): a \operatorname{lin} A, b$ in $B\} \backslash r i g h t \mid\} \backslash)$
If either $\backslash(A \backslash)$ or $\backslash(B \backslash)$ is the null set, then $\backslash(A \backslash t i m e s ~ B \backslash)$ will also be empty set, i.e., $\backslash(A$ ltimes $B \backslash)$

## Important tips

Two ordered pairs are equal, if and only if the corresponding first elements are equal and the second elements are also equal.
If there are $\backslash(p \backslash)$ elements in $\backslash(A \backslash)$ and $\backslash(q \backslash)$ elements in $\backslash(B \backslash)$, then there will be $\backslash(p q \backslash)$ elements in $\backslash(A \backslash t i m e s ~ B \backslash)$, i.e., if $\backslash(n \backslash l e f t(A \backslash r i g h t)=p \backslash)$ and $\backslash(n \backslash l e f t(B \backslash$ right $)=q \backslash)$, then $\backslash(n \backslash \operatorname{left}(\{A \backslash$ times $B\} \backslash r i g h t)=p q \backslash)$.

If $\backslash(A \backslash)$ and $\backslash(B \backslash)$ are non-empty sets and either $\backslash(A \backslash)$ or $\backslash(B \backslash)$ is an infinite set, then so is $\backslash(A$ ltimes $B \backslash)$.
$\backslash(A \mid t i m e s A \backslash t i m e s ~ A=\ l e f t \backslash\{\backslash l e f t(\{a, b, c\} \backslash$ right $): a, b, c \backslash \operatorname{lin} A\} \backslash$ right $\mid\} \backslash)$. Here $\backslash(\{\backslash \operatorname{left}(\{a, b, c\} \backslash r i g h t)\} \backslash)$ is called an ordered triplet
Questtion 1 If $\backslash(P=\backslash \operatorname{left} \backslash\{\{1,2\} \backslash$ right $\backslash\} \backslash)$ and $\backslash(Q=\backslash \operatorname{left} \backslash\{\{5,4,2\} \backslash$ right $\backslash\} \backslash)$, find $\backslash(P \backslash$ times $Q \backslash)$ and $\backslash(Q \backslash$ times $P \backslash)$.

## Solution

$\backslash(P=\backslash \operatorname{eft} \backslash\{\{1,2\} \backslash$ right $\mid\} \backslash)$ and $\backslash(Q=\backslash \operatorname{eft} \backslash\{\{5,4,2\} \backslash$ right $\mid\}\rangle)$
We know that the Cartesian product $\backslash(P$ \times $Q \backslash$ ) of two non-empty sets $\backslash(P \backslash)$ and $\backslash(Q \backslash)$ is defined as $\backslash(P$ \times $Q=\ \operatorname{left} \backslash\{\{\backslash \operatorname{left}(\{p, q\} \backslash r i g h t): p$ in $P, q \backslash i n Q\} \backslash r i g h t \mid\} \backslash)$
 \right), $\backslash$ left( $\{2,2\} \backslash$ right $)\} \backslash$ right $\backslash\} \mid$ )
$\backslash(Q \backslash t i m e s P=\backslash \operatorname{left} \backslash\{\{\operatorname{left}(\{5,1\} \backslash$ right $), \backslash \operatorname{eft}(\{5,2\} \backslash$ right $), \backslash \operatorname{left}(\{4,1\} \backslash$ right $), \backslash \operatorname{left}(\{4,2\} \backslash$ right $), \backslash \operatorname{left}(\{2,1\} \backslash$ right $), \backslash \operatorname{left}($ $\{2,2\} \backslash$ right $)\} \backslash$ right $\mid\} \backslash)$

Question 2 If $\backslash(A=\backslash \operatorname{left} \backslash\{\{-1,1\} \backslash$ right $\backslash\} \backslash)$, find $\backslash(A \mid$ times $A \backslash t i m e s ~ A \backslash)$

## Solution

It is known that for any non-empty set $\backslash(A \backslash), \(A \backslash t i m e s ~ A \backslash t i m e s ~ A \backslash)$ is defined as
$\backslash(A \backslash t i m e s ~ A \mid t i m e s ~ A=\backslash l e f t \backslash\{\{\backslash \operatorname{left}(\{a, b, c\} \backslash$ right $): a, b, c \backslash i n A\}|r i g h t|\} \backslash)$
It is given that $\backslash(A=\backslash \operatorname{left} \backslash\{-1,1\} \mid$ right $\mid\} \mid)$
$\($ ltherefore $A$ ltimes $A$ ltimes $A l l e f t \backslash\{\{\backslash \operatorname{left}(\{-1,-1,-1\} \backslash$ right $), \ \operatorname{left}(\{-1,-1,1\} \backslash$ right $), \ \operatorname{left}(\{-1,1,-1\}$ $\backslash$ right), $\backslash \operatorname{left}(\{-1,1,1\} \backslash$ right $), \operatorname{left}(\{1,-1,-1\} \backslash$ right $), \operatorname{left}(\{1,-1,1\} \backslash$ right $), \operatorname{lleft}(\{1,1,-1\} \backslash \operatorname{right}), \operatorname{left}(\{1,1,1\} \backslash$ right $)$, |right $\mid\} \mid$ )

## 2. What is relations?

A relation $\backslash(R \backslash)$ from a non-empty set $\backslash(A \backslash)$ to a non-empty set $\backslash(B \backslash)$ is a subset of the cartesian product $\backslash(A$ \times B<br>).
It "maps" elements of one set to another set. The subset is derived by describing a relationship between the first element and the second element of the ordered pair <br>(\left( $\{A$ \times $B\} \backslash r i g h t) \backslash)$.
Domain: The set of all first elements of the ordered pairs in a relation $\backslash(R \backslash)$ from a set $\backslash(A \backslash)$ to a set $\backslash(B \backslash)$ is called the domain of the relation $\backslash(R \backslash)$.
Range: the set of all the ending points is called the range
A relation can be expressed in Set builder or Roaster form

## Roster forms

In a Roster forms, all the elements in the set is listed.

## Example

Set of $\backslash($ vovel $=\backslash$ left $\backslash\{a, e, i, o, u\} \backslash r i g h t \backslash\} \backslash)$

## Some Important points

In roster form, the order in which the elements are listed is immaterial
while writing the set in roster form an element is not generally repeated

## Set Builder Form

In set-builder form, all the elements of a set possess a single common property which is not possessed by any element outside the set. For example, in the set $\backslash(\backslash l e f t \backslash\{\{2,4,6,8\} \backslash r i g h t \backslash\} \backslash)$, all the elements possess a common property, namely, each of them is a even number less than 10 . Denoting this set by $\backslash(N \backslash)$, we write $N=\{x: x$ is a even number less than 10$\}$
b) We describe the element of the set by using a symbol $\backslash(x \backslash)$ (any other symbol like the letters $\backslash(y \backslash)$, $\backslash(z \backslash)$, etc. could be used) which is followed by a colon " : ". After the sign of colon, we write the characteristic property possessed by the elements of the set and then enclose the whole description within braces

## Important Note

The total number of relations that can be defined from a set $\backslash(A \backslash)$ to a set $\backslash(B \backslash)$ is the number of possible subsets of $\backslash(A \backslash \operatorname{cdot} B \backslash)$. If $\backslash(n \backslash \operatorname{left}(A \backslash$ right $)=p \backslash)$ and $\backslash(n \backslash l e f t(B \backslash$ right $)=q \backslash)$, then $\backslash(n \backslash \operatorname{left}(\{A \backslash \operatorname{cdot} B\} \backslash$ right $)=p q \backslash)$ and the total number of relations is $\backslash\left(\left\{2^{\wedge}\{p q\}\right\} \backslash\right)$

## Example:

Let $\backslash(P=\backslash \operatorname{left} \backslash\{\{1,2,3, \ldots ., 18\} \backslash$ right $\mid\} \backslash)$ define a relation $\backslash(R \backslash)$ from $\backslash(P \backslash)$ to $\backslash(P \backslash)$ by $\backslash(R=\backslash \operatorname{eft} \backslash\{\{\backslash \operatorname{left}(\{x, y\} \backslash$ right $): 2 x$ $-y=0$, where $\{\backslash r m\}\} x, y \backslash i n P\} \backslash r i g h t \mid\} \backslash)$ Write down its domain, codomain and range.
Solution: The relation $\backslash(R \backslash)$ from $\backslash(P \backslash)$ to $\backslash(P \backslash)$ is given as

$$
\begin{aligned}
& R=\{(x, y): 2 x-y=0 \text {, where } x, y \square P\} \\
& \text { i.e., } R=\{(x, y): 2 x=y \text {, where } x, y \square P\}
\end{aligned}
$$

$\backslash(\backslash$ therefore $R\{\backslash \mathrm{rm}\}\}=\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{left} \backslash\{\{\operatorname{left}(\{1,\{\backslash \mathrm{rm}\{ \}\} 2\} \backslash$ right $),\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{left}(\{2,\{\backslash \mathrm{rm}\{ \}\} 4\} \backslash$ right $),\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{left}(\{3,\{\backslash \mathrm{rm}\{$
 $\}\} \backslash \operatorname{left}(\{7,\{\backslash \mathrm{rm}\{ \}\} 14\} \backslash$ right $),\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{left}(\{8,\{\backslash \mathrm{rm}\{ \}\} 16\} \backslash$ right $), \ \operatorname{left}(\{9,18\} \backslash$ right $)\} \backslash$ right $\mid\} \backslash)$
The domain of $\backslash(R \backslash)$ is the set of all first elements of the ordered pairs in the relation.
$\backslash(\backslash$ therefore Domain $\{\backslash \mathrm{rrm}\}\}$ off $\{\mathrm{rm}\}\} \mathrm{R}\{\backslash \mathrm{rm}\}\}=\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{left} \backslash\{\{1,\{\backslash \operatorname{rrm}\{ \}\} 2,\{\backslash \mathrm{rm}\{ \}\} 3,\{\backslash \mathrm{rm}\{ \}\} 4,5,6,7,8,9\} \backslash \operatorname{right} \mid\} \backslash)$ The whole set $\backslash(P \backslash)$ is the codomain of the relation $\backslash(R \backslash)$.
Therefore codomain of $\backslash(R\{\backslash r m\}\}=\{\backslash r m\{ \}\} P\{\backslash \operatorname{rrm}\{ \}\}=\{\backslash \operatorname{rm}\{ \}\} \backslash \operatorname{left} \backslash\{1,\{\backslash \mathrm{rm}\{ \}\} 2,\{\backslash \mathrm{rm}\{ \}\} 3,\{\backslash \mathrm{rm}\{ \}\} \backslash \operatorname{ldots},\{\backslash \mathrm{rm}\{ \}\} 18\}$ |right $\mid\} \mid$ )
The range of $\backslash(R \backslash)$ is the set of all second elements of the ordered pairs in the relation.
Therefore range of $\backslash(R=\backslash \operatorname{eft} \backslash\{2,\{\backslash \mathrm{rm}\{ \}\} 4,\{\backslash \mathrm{rm}\{ \}\} 6,\{\backslash \mathrm{rm}\{ \}\} 8,10,12,14,16,18\} \backslash$ right $\mid\} \backslash)$

## 3. What is Function

A function is a "well-behaved" relation
A function $\backslash(f \backslash)$ is a relation from a non-empty set $\backslash(A \backslash)$ to a non-empty set $\backslash(B \backslash)$ such that the domain of $\backslash(f)$ is $\backslash(\mathrm{A} \backslash)$ and no two distinct ordered pairs in $\backslash(\mathrm{f} \backslash)$ have the same first element.
For a relation to be a function, there must be only and exactly one $\backslash(y \backslash)$ that corresponds to a given $\backslash(x \backslash)$ If $\backslash(f \backslash)$ is a function from $\backslash(A \backslash)$ to $\backslash(B \backslash)$ and $\backslash(\backslash \operatorname{left}(\{a,\{\backslash r m\{ \}\} b\} \backslash$ right $)$ in $f)$, then $\backslash(f \backslash \operatorname{left}(a \backslash$ right $)=b \backslash)$, where $\backslash(b \backslash)$ is called the image of $\backslash(a \backslash)$ under $\backslash(\mathrm{f} \backslash)$ and $\backslash(a \backslash)$ is called the preimage of $\backslash(\mathrm{b} \backslash)$ under $\backslash(\mathrm{f} \backslash)$.

## Example 1:

Which of the following relations are functions? Give reasons. If it is a function, determine its domain and range. $\backslash(\backslash \operatorname{left} \backslash\{\backslash \operatorname{left}(\{3,1\} \backslash$ right $), \operatorname{lleft}(\{5,1\} \backslash$ right $), \ \operatorname{left}(\{7,1\} \backslash$ right $), \ \operatorname{left}(\{11,1\} \backslash$ right $), \backslash \operatorname{left}(\{14,1\} \backslash$ right $), \backslash \operatorname{left}(\{17,1\}$ |right)\} $\backslash$ right $\rangle \backslash$ )
$\backslash(\{\backslash \operatorname{left}\{\{\backslash \operatorname{left}(\{2,1\} \backslash$ right $), \operatorname{ll} \operatorname{left}(\{4,2\} \backslash$ right $), \operatorname{lleft}(\{6,3\} \backslash$ right $), \operatorname{lleft}(\{6,4\} \backslash$ right $), \operatorname{lleft}(\{10,5\} \backslash$ right $), \backslash \operatorname{left}(\{12,6\}$ |right), $\backslash \operatorname{left}(\{14,7\} \backslash$ right $)\} \backslash$ right $\mid\}\} \backslash)$
$\(\{\backslash \operatorname{left} \backslash\{\{\backslash \operatorname{left}(\{1,3\} \backslash$ right $), \backslash \operatorname{left}(\{1,5\} \backslash$ right $), \backslash \operatorname{left}(\{2,5\} \backslash$ right $)\} \backslash$ right $\mid\}\} \backslash)$

## Answer

 |right)\} $\backslash$ right $\mid\} \mid$ )
Since $3,5,8,11,14$, and 17 are the elements of the domain of the given relation having their unique images, this relation is a function.
 \right), $\operatorname{left}(\{14,7\} \backslash$ right $)\} \backslash$ right $\mid\}\} \backslash \backslash$
Since the same first element i.e 6 corresponds to two different images 3 and 4, this relation is not a function

Since the same first element i.e., 1 corresponds to two different images i.e., 3 and 5 , this relation is not a function.

## Important functions

Let us take some useful polynomial and shapes obtained on the Cartesian plane
S.No.

$$
\backslash(y=p \backslash \operatorname{left}(x \backslash \text { right }) \backslash)
$$

Graph
Name of the graph

Name of the

|  |  | obtained |  | function |
| :---: | :---: | :---: | :---: | :---: |
| 1. | $\backslash(y=m x+c l)$ where $m$ and $c$ can be any values $\backslash($ lleft $(\{m \operatorname{lne} 0\} \backslash$ right $)$ ) Example $\backslash(y=2 x+3)$ |  | Graphs of these functions are straight lines. <br> $\backslash(\mathrm{ml})$ is the slope and $\backslash(b \backslash)$ is the $\backslash(y \backslash)$ intercept. If $\backslash(\mathrm{ml})$ is positive then the line rises to the right and if $\backslash(\mathrm{ml})$ is negative then the line falls to the right | Linear function. Typical use for linear functions is converting from one quantity or set of units to another. |
| 2. | $\backslash\left(y=a\left\{x^{\wedge} 2\right\}+b x+c \mid\right)$ <br> where, $\backslash\left(\left\{b^{\wedge} 2\right\}-4 a c\{1 r m\{ \}\}>\{1 r m\{\right.$ <br> \}\}01), $\backslash(a \backslash n e 01)$ and $\backslash(a>\{\backslash r m\{ \}\} 0 \backslash)$ <br> example- $\backslash\left(y=\left\{x^{\wedge} 2\right\}-7 x+121\right)$ | $V$ | Parabola <br> It intersect the $x$ - axis at two points <br> Example- $(3,0)$ and $(4,0)$ | Quadratic function |
| 3. | $\begin{aligned} & \backslash\left(y=a\left\{x^{\wedge} 3\right\}+b\left\{x^{\wedge} 2\right\}+c x+d \backslash\right) \\ & \text { where, } \backslash(a \text { Ine } 0 \backslash) \end{aligned}$ | It can be of any shape $N$ | It will cut the $x$-axis at the most 3 times | Cubic Function |
| 4. |  | It can be of any shape | It will cut the $x$-axis at the most n times | Polynomial function |
| 5. | $\backslash(\mathrm{y}=\backslash \mathrm{frac}\{\{\mathrm{f}(\mathrm{x})\}\}\{\{\mathrm{g}(\mathrm{x})\}\} \backslash \mid)$ <br> where $\backslash(g(x)$ Ine $0 \backslash)$ <br> example- $\backslash(y=\backslash f r a c\{1\} x\}\})$ | It can be any shape | An asymptote is a line that the curve approaches but does not cross.There are vertical and horizontal asymptote | Rational function |
| 6. | $\begin{aligned} & \backslash(y=\backslash \text { left } \mid x \backslash \text { right } \mid \text { ) } \\ & \text { i.e., } \backslash(y=-x \backslash) \text { for } \backslash(x<0 \backslash) \end{aligned}$ |  |  | Modulus |

## 4. Algebra of Real Function

Real Value Function: A function which has all real number or subset of the real number as it domain Real Valued Function: A function which has all real number or subset of the real number as it range For functions $\backslash(f:\{\backslash \mathrm{rm}\{ \}\} X->\{\backslash b f\{R\}\} \backslash)$ and $\backslash(\mathrm{g}:\{\backslash \mathrm{rm}\{ \}\} \mathrm{X}->\{\backslash \mathrm{bf}\{R\}\} \backslash)$, we have Addition
$\backslash(\backslash \operatorname{left}(\{f+g\} \backslash$ right $) \backslash \operatorname{left}(x \backslash$ right $)=$ fleft $(x \backslash$ right $)+g \backslash \operatorname{left}(x \backslash$ right $), x$ in $X \backslash)$
Substraction
$\backslash(\backslash \operatorname{left}(\{f-g\} \backslash$ right $) \backslash \operatorname{left}(x \backslash$ right $)=$ fleft $(x \backslash$ right $)-g \backslash$ left $(x \backslash$ right $), x$ in $X \backslash)$

## Multiplication

$\backslash(\backslash \operatorname{left}(\{f . g\} \backslash \operatorname{right}) \backslash \operatorname{left}(x \backslash$ right $)=$ fleft $(x \backslash$ right $) . g \backslash \operatorname{left}(x \backslash$ right $), x$ in $X \backslash)$
Multiplication by real number $\backslash(\backslash \operatorname{left}(\{k f\} \backslash r i g h t) \backslash \operatorname{left}(x \backslash r i g h t)=k\{\backslash r m\{ \}\} f l \operatorname{left}(x \backslash r i g h t), x$ in $X \backslash)$, where $\backslash(k \backslash)$ is a real number.
Division
$\(\mid$ frac $\{f\}\{g\} \backslash$ left $(x$ |right $)=\backslash$ frac $\{\{f(x)\}\}\{\{g(x)\}\} \backslash)$
$\(x \operatorname{lin} X I)$ and $\backslash(g \backslash e f t(x \backslash$ right $)$ ne $0 \backslash)$

## Chapter 2:

## Relations and Functions

## Concept:

Cartesian products of sets - equality of ordered pairs- triple product-relations- functions- domain- range- different types of functions- algebra of functions.
Notes:

- If $(a, b)=(c, d)$ then $a=c$ and $b=d$.
- $A x B=\{(x, y) / x \in A, y \in B\}$
- $\operatorname{AxAxA}=\{(x, y, z) / x, y, z \in A\}$
- A relation R is a subset of the Cartesian product.
- A function is a relation with every element of first set has one only one image in second set.
- The set of all first elements of the ordered pairs in a function is called domain.
- The set of all second elements of the ordered pairs in a function is called the range.
- Second set itself is known as co-domain.

## Text book questions

Ex: 2.1
Ex: 2.2
Ex:2.3
Misc. Ex:
Questions: 1, 2 ${ }^{*}, 5^{*}, 7^{*}$
Questions: 1, 2, 6, $7^{*}$
Questions: $2^{*}, 5^{*}$
Questions: $3^{*}, 4,6,8,11,12$

Question: 22*

## Extra/HOT questions

1. Find $x$ and $y$ if $\left(x^{2}-3 x, y^{2}-5 y\right)=(-2,-6)$.
2. Draw he graph of the following functions:
a) Modulus function in $[-4,4]$
b) Signum function in $[-6,6]$
c) Greatest integer function in $[-3,4]$
3. Find the domain of the following functions:
a) $f(x)=\frac{x^{2}-1}{x-1}$
b) $f(x)=\frac{3 x+1}{x^{2}-5 x+6}$
c) $f(x)=\frac{2 x-3}{(x-1)(x+2)}$
4. Find the domain and range of the following functions:
a) $f(x)=\frac{1}{9-x^{2}}$
b) $f(x)=\sqrt{x^{2}-1}$
c) $f(x)=\frac{1}{x^{2}+4}$
d) $f(x)=\frac{|x|}{1+|x|}$
5. If $f(x)=x^{2}+\frac{1}{x^{2}}$ then show that $\mathrm{f}(\mathrm{a})=\mathrm{f}(1 / \mathrm{a})$ and also evaluate $\mathrm{f}(3 / 2)-\mathrm{f}(2 / 3)$
6. Let $\mathrm{R}=\{(\mathrm{x}, \mathrm{y}) / \mathrm{x}, \mathrm{y} \in \mathrm{N}, \mathrm{x}+2 \mathrm{y}=13\}$ then write R as an ordered pair and also find the domain and range.
7. Let $A=\{x / x$ is a natural number $<12\}$ and $R$ be a relation in $A$ defined by $(x, y)$ in $R$ if $x+y=12$, then write $R$.
8. A function f is defined on the set of natural numbers as

$$
f(x)=\left\{\begin{array}{c}
x^{2} \text { if } 1 \leq x<5 \\
x+3 \text { if } 5<x \leq 8 \\
\frac{x-3}{2} \text { if } 8<x \leq 11
\end{array}\right.
$$

Write the function in roster form and also find the domain and range of the function.
9. Let $A=\{1,2,3,4\}, B=\{-1,0,1\}$ and $C=\{3,4\}$ then verify the following:
a) $\mathrm{AX}(\mathrm{B} \mathrm{U} \mathrm{C})=(\mathrm{AXB}) \mathrm{U}(\mathrm{AXC})$
b) $\mathrm{AX}(\mathrm{B}-\mathrm{C})=(\mathrm{AXB})-(\mathrm{AXC})$
c) $A X(B \cap C)=(A X B) \cap(A X C)$
10. If $\mathrm{A}=\{-3,-2,0,2,3\}$ write the subset B of $\mathrm{A} X \mathrm{~A}$ such that first element of $B$ is either -3 or +3 .
